# Message

## Dear Colleagues:

With the cooperation of the physicians, co-medical staff, and companies concerned, the number of participants in the 2007 Tokyo Percutaneous cardiovascular Intervention Conference (TOPIC 2007) reached approximately 2,500, which was far larger than in 2006. We wish to express our sincere gratitude to all participants for their interest and efforts in helping us to make this conference fruitful.

TOPIC 2008 is scheduled to be held in July 2008. In the field of coronary artery disease, the previous TOPICs have pursued two main themes. One is expansion of the indications for percutaneous treatment. We believe that chronic total occlusion (CTO) is the most important issue in this respect, since the presence of CTO is the main reason for using coronary artery bypass grafting to perform coronary revascularization. Japan has played an active role in this field and is recognized as a leader. In addition to antegrade approaches, such as the parallel wire technique and intravascular ultrasound-guided wiring, there is increasing interest in retrograde approaches and multislice computed tomography-guided wiring. At the previous TOPICs, there were sessions focusing on CTO, as well as a number of live demonstrations. The most recent therapeutic strategies for CTO will also be discussed at TOPIC 2008. In addition, we also intend to focus on left main trunk lesions, bifurcation lesions, and severely calcified lesions, for which standard percutaneous strategies have not yet been established. To increase the use of percutaneous intervention, we understand that it is important to further minimize invasion by using the radial approach or by pursuing advances in imaging modalities other than coronary angiography.

Another theme is re-confirmation of the safety and efficacy of drug-eluting stents (DES). The protective effect of DES against restenosis is clear, but some concerns have been expressed about the long-term safety of these stents since the summer of 2006. Despite this, the long-term results obtained with DES in Japan have been excellent. What is the reason for this difference? The cooperation of overseas institutions will be essential to pursue this theme. We expect that international faculties with longer and wider experience of DES will present their data and we will be able to have in-depth discussions.

The role of interventional cardiologists in the treatment of peripheral artery disease is regarded as increasingly important. Last year, there were many participants in the live video demonstrations and training courses related to peripheral intervention. For TOPIC 2008, we are also arranging some excellent sessions on peripheral intervention.

Since interventional cardiology is a branch of medicine, emphasis should of course be placed on scientific evidence. However, once we engage in the treatment of patients, we cannot ignore the influence of experience. At TOPIC 2008, we will propose a new theme which is the blending of science and art:

Truth in evidence and experience  
 Optimize decision making  
 Predict short- and long-term outcomes  
 Innovation in devices, techniques, and strategies  
 Confirm the future of interventional cardiology
